Implementación (C#)

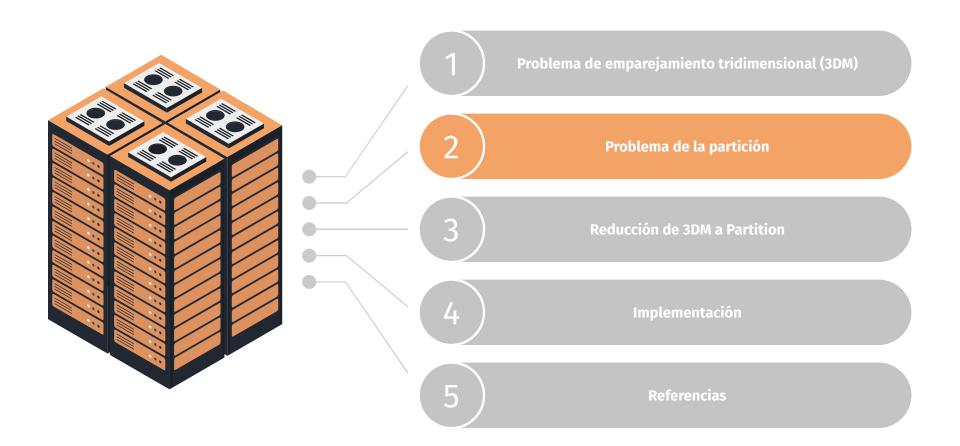

1. Problema de emparejamiento tridimensional (3DM)

Sean los conjuntos M, W, X e Y tal que |W|=|X|=|Y|=q, y además, M \subseteq W x X x Y.

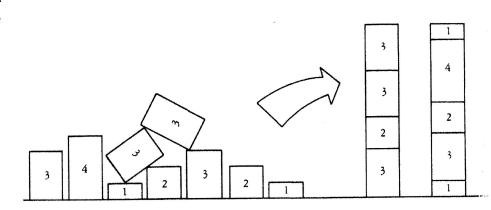

Buscamos encontrar un $M' \subseteq M$, tal que cubra todos los elementos de W, X y Y y solo los incluya una vez.

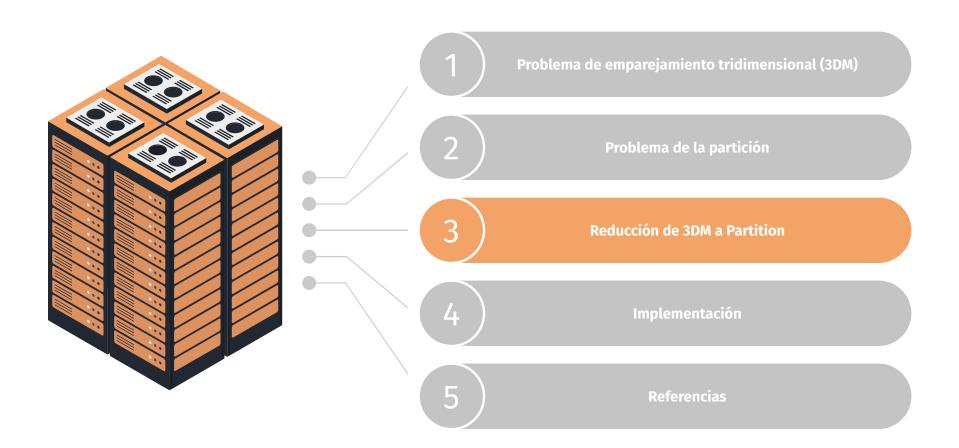

2. Problema de la partición (Partition)

Partimos de una lista de números L, la cual la tenemos que dividir en dos listas L_1 y L_2 , tal que $\Sigma(L_1) = \Sigma(L_2)$

3.1. Inicialización

Partimos de los conjuntos W, X, Y y M.

Los conjuntos W, X e Y deben tener la misma longitud. Mientras, el conjunto M, es una salida válida del problema 3DM con una cardinalidad propia.

$$W = \{w_1, w_2, ..., w_q\}$$

 $X = \{x_1, x_2, ..., x_q\}$
 $Y = \{y_1, y_2, ..., y_q\}$
 $M = \{m_1, m_2, ..., m_k\}$

$$k = |M|$$
$$q = |W| = |X| = |Y|$$

3.2 Representación en binario

Necesitamos 3q zonas de tamaño p.

La que será la cardinalidad de nuestros conjuntos de entrada.

$$p = [\log_2 k + 1]$$

3.3. EJEMPLO

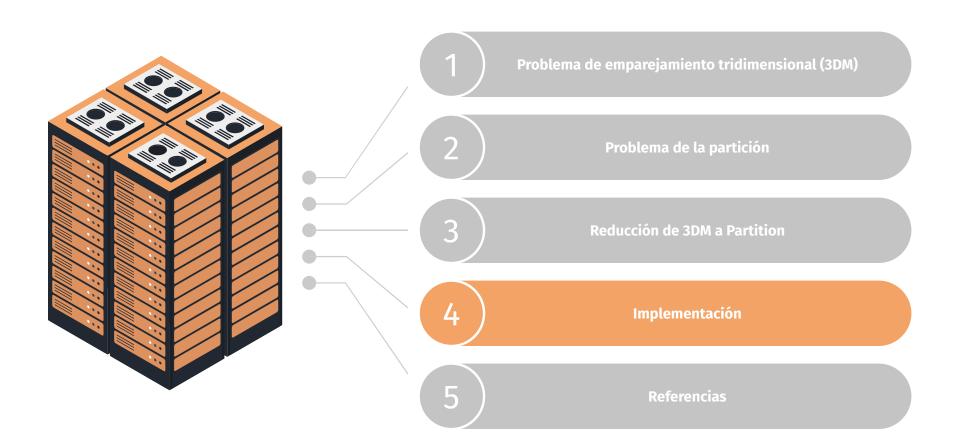

Supongamos unos conjuntos W, X e Y con cardinalidad 4.

	w_1	w_2	w_3	w_4	x_1	x_2	<i>x</i> ₃	x_4	y_1	y_2	<i>y</i> ₃	y_4	Decimal

3.4 Cálculo de b1 y b2

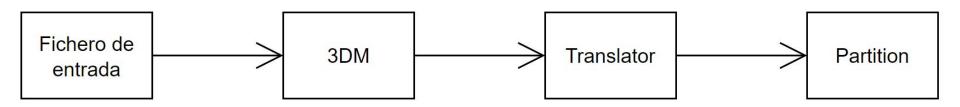

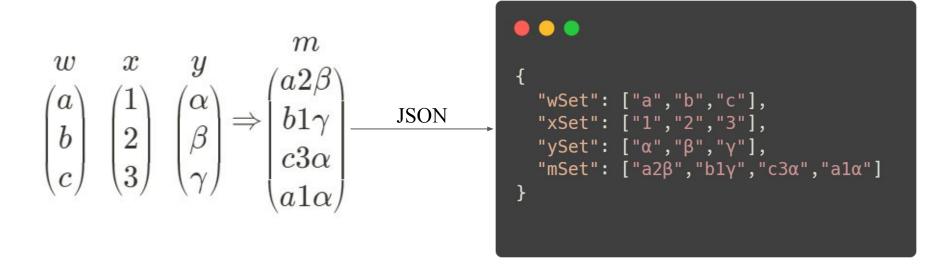

4.Implementación

Se ha optado por desarrollar el programa en C# con la siguiente estructura:

4.1. Clase Program

4.2. Fichero de entrada

4.3. Clase 3DM

```
public class _3DM {
    private uint sizeM_;
    private uint sizeWXY_;
    private string[] wSet_;
    private string[] xSet_;
    private string[] ySet_;
    private string[,] mSet_;
}
```

4.3. Clase 3DM

```
public class _3DM {
   public _3DM(string inputFileName) { ... }
   private void CheckValues(Dictionary<string, String[]> jsonMap) { ... }
   public uint GetMSize() { ... }
   public uint GetWXYSize() { ... }
   public int GetElementPositionInSet(string element, string setName) { ... }
   public string GetElement(int triplet, int position) { ... }
   public void Print() { ... }
}
```

4.4. Clase Partition

```
public class Partition {
    private ulong[] numbers_;
    public Partition(ulong[] numberList) {
        numbers_ = numberList;
    public void WriteToFile(string outputFilePath) {
        string jsonString = JsonSerializer.Serialize(numbers_);
        File.WriteAllText(outputFilePath, jsonString);
```

4.5. Clase Translator

```
public class Translator {
  public static Partition Translate3DMToPartition(_3DM original_problem) {
    uint sizeM = original_problem.GetMSize();
    double numberOfBits = Math.Ceiling(Math.Log(sizeM + 1.0f, 2f));
    uint sizeWXY = original problem.GetWXYSize();
    ulong sum = 0;
    List<ulong> numbers = new List<ulong>();
    const uint one = 1;
```

4.5. Clase Translator

```
public class Translator {
 public static Partition Translate3DMToPartition(_3DM original_problem) {
    for (int triplet = 0; triplet < sizeM; ++triplet) {</pre>
     ulong newNumber = 0;
     string firstElement = original_problem.GetElement(triplet, 0);
     string secondElement = original problem.GetElement(triplet, 1);
     string thirdElement = original_problem.GetElement(triplet, 2);
     int firstPosition = original_problem.GetElementPositionInSet(firstElement, "w");
     int secondPosition = original_problem.GetElementPositionInSet(secondElement, "x");
     int thirdPosition = original_problem.GetElementPositionInSet(thirdElement, "y");
     ulong first = (ulong)(Math.Pow(2, (numberOfBits * (3 * sizeWXY - firstPosition - 1))));
     ulong second = (ulong)(Math.Pow(2, (numberOfBits * (2 * sizeWXY - secondPosition - 1))));
     ulong third = (ulong)(Math.Pow(2, (numberOfBits * (sizeWXY - thirdPosition - 1))));
     newNumber = first + second + third;
     numbers.Add(newNumber);
      sum += newNumber;
```

4.5. Clase Translator

```
public class Translator {
 public static Partition Translate3DMToPartition(_3DM original_problem) {
   ulong matchingChecker = 0;
    for (int currentSet = 2; currentSet >= 0; currentSet--) {
     for (int currentElement = (int)sizeWXY - 1; currentElement >= 0; currentElement--) {
        int shift = (int)(((currentSet * numberOfBits * 3) + ((2 - currentElement) * numberOfBits)));
       matchingChecker |= one << shift;</pre>
    ulong b1 = 2 * sum - matchingChecker;
    ulong b2 = sum + matchingChecker;
   numbers.Add(b1);
    return new Partition(numbers.ToArray());
```
